                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  LOCUS
                                                                                                                                                                                                                                                                                                                                                                                                                                 셤
```

```
NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
```

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

Mapping information for this clone was provided by Dr. John D. McPherson, Department of Genetics, Washington University, St. Louis Mo. For additional information about the map position of this sequence, see http://genome.wustl.edu/gsc MAPPING INFORMATION:

The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, E. Tateno, M., Catanese, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and Coworkers at http://www.chori.org SOURCE INFORMATION:

The clone sequenced to the right is RP11-310A13. Actual start of this clone is at base position 1 of RP11-733C7; actual end is at base position 161280 of RP11-733C7. NEIGHBORING SEQUENCE INFORMATION:

VECTOR: pBACe3.6

Data from AC009792 was used to finish the clone, AC055827

```
The sequence of AC055827 has been incorporated into AC093903.

```
The invention relates to isolated lung tumour-specific proteins and their corresponding cDNA molecules. Lung tumour-specific proteins and their antigen presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer. The invention also relates to a composition useful for stimulating an immune response, and for treating cancer. The lung tumour specific oligonalcottde is useful in gene therapy and for diagnosis, detection and treatment of lung cancer. The present sequence is a cDNA encoding human lung tumour-specific protein.
                                                                                                                                              Ğ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             64

The invention relates to isolated lung tumour-specific proteins and their corresponding CDNA molecules. Lung tumour-specific proteins and their antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer. The invention also relates to a composition useful for stimulating an immune response, and for treating cancer. The lung tumour specific oligonucleotide is useful in gene therapy and for diagnosis, detection and treatment of lung cancer. The present sequence is a cDNA encoding human lung tumour-specific protein.

The invention relates to isolated lung tumour-specific proteins and their corresponding cDNA molecules. Lung tumour-specific proteins and their antigen presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer. The invention also relates to a composition useful for stimulating an immune response, and for treating cancer. The lung tumour specific oligonucleotide is useful in gene therapy and for diagnosis, detection and treatment of lung cancer. The present sequence is a cDNA encoding human lung tumour-specific protein.
                                                                                                                                                                                                                                                                                                                                                                                                                           Reed SG, Lodes MJ, Mohamath R, Secrist H, Benson DR, Indirias CY;

```
ABL36412 to ABL38645 represent human colon tumour antigen cDNA clones (I) which were isolated from human colon tumour and colon metastatic tumour cDNA libraries. (I) have cytostatic activity and can be used in vaccine production. (I) can be used for stimulating and/or expanding T cells specific for a tumour protein on contact with the T cells. They are also useful for inhibiting the development of cancer in a patient. (I) can be used as probes or primers for nucleic cald hybridisation, for preparing mutant species primers, or primers for use in genetic constructions. (I) can be used in the diagnosis of a colon tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel isolated colon tumor polynucleotide differentially expressed in colon tumor or colon metastatic tumor and polypeptides encoded by them, useful for inhibiting development of cancer in patient -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               93

The invention relates to an isolated polynucleotide (I) encoding a polypeptide (II) comprising at least a portion of a colon tumour conjugation. (I), (II) and antibody (III) to (II) are useful for determining the presence of a cancer in a patient. (I), (II) or antigen presenting cells expressing (I) is useful for stimulating and/or expanding T cells specific for a tumour protein, by contacting T cells with (I), (II) or antigen-presenting cells that express (I), under conditions and for a time sufficient to permit the stimulation and/or expansion of T cells.

CC (I), (II), or antigen presenting cells that express (II) are useful for treating colon cancer in a patient by incubating CD4+ and/or CD8+ T cells (I), (II) or antigen presenting cells that cerpress (II), such that T cells proliferate, and administering to the patient an effective amount of the proliferated T cells, thus inhibiting continuous and pharmaceutical compositions for prevention and treatment concerns and pharmaceutical compositions for prevention and treatment concerns. (II), (II) is useful for detection, diagnosis and/or therapy of human colon cancer. (I) is useful as a probe or primer for theory of human colon cancer. (I) is useful as a probe or primer for cancers. (I), (II) or in the design and preparation of cancer coding expression of (II) in tumour cells.

The present invention describes a library of human polynucleotides comprising the sequences given in AAZ1253 to AAZ1779. Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell cancerous, where the gene product is encoded by one of the 5248 polynucleotide sequences given in AAZ12532 to AAZ1779. The polynucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, mapping, tissue typing or profiling, forensics, genetic analysis and detection of polymorphisms. Polypeptides encoded by the polynucleotides can be used for raising antibodies for experimental, diagnostic and therefore arrays for diagnostics (which may be used to determine function of an encoded protein); and to detect differences in expression levels be encoded protein); and to detect differences in expression levels because the construct arrays for diagnostics (which may be used to determine function of an encoded protein); and to detect differences in expression levels because the formation of the invention are especially used in the diagnosis, prognosis and management of colorectal cancer, breast cancer, and lung cancer. The polynucleotides can also be used to screen for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    peptide analogues and antagonists.

Sequences Abbio181-Abbi1330 Teppesant 1330 movet movet be sequences Abbio1825-Abbi09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, and methods of producing the novel polypeptides of the invention. Although novel, many of the nucleotides of the invention have homology to known proteins, thereby bind to polypeptides of the invention have bomology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention have bomology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may be immunomodulatory activity; activit or inhibin related activity; immunomodulatory activity; activit or light activity; immunomodulatory activities; needpto or light activities; chemotratic chemokinetic activities; neamostatic, thrombotic or chemokinetic activities; haemostatic, thrombotic or chemokinetic activities; neamostatic, thrombotic or chemokinetic activities; neamostatic, thrombotic or involved in oncogenesis, cancer cell proliferation or metastasis.

Comparison on their biological activities, polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or generating treating cell for preventing, treating or ameliorating medical conditions, e.g., by protein or generating treating cell cancers, hematropoletic disorders (e.g., maybelide or lympholetic active and properties in additions in a submormal vascular growth. Polypeptides involved with tissue regeneration and caterial and fungal infessions and ulcers), while those with immunomodulatory activities may be used in the treatment of viral, beatling (e.g., of burns, incisions and ulcers), while those with growth factor activity may be used to nau

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea from the and tomato. These were derived from expressed sequence tags (ESTs) forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a cDNA

ANK AAK54951 to AAK64702 encode the human immune/haematopoletic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased example, they may be used to treat disorders associated with decreased example, they may be used to treat disorders associated with decreased example, they may be used to production of (I). Additionally, (I) supplement the patients own production of (I). Additionally, (I) complement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic antigen genomic sequences from the present invention. AAK54942 to AAK676950 and AAM82169 crepresent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a genomic sequence encoding a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      16027 TTTTTTTTTTTTTTTTTTTTTTTTTTTGAGATGGAGTTTCACTCGTTGCCCAGGC 16086

The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a genomic sequence encoding a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; testicular antigen; testes; cancer; metastasis; immune disorder; reproductive system disorder; urinary system disorder; gene therapy; cardiovascular disorder; respiratory disorder; neurological disorder; gastrointestinal disease; infection; cytostatic; gene; ds.

```
The present invention provides the protein and coding sequences of 973 human testicular antigens, and fragments of their genomic sequences. The sequences can be used in the treatment of cardiovascular, urinary system, reproductive system, immune, respiratory, neurological and gastrointestinal disorders, infections, and particularly cancer, especially testicular cancers. The present sequence is a DNA encoding a protein fragment of the invention.
                                                                                                                                                                                                                                                                                                                                                                    16027 TITITITGECTITITITITITITITITITITITGEGAGITICACTCGTIGCCCAGGC 16086

Suppressor gene BRG1 in cancer diagnosis and therapy. This gene is comprised of several exons, shown in AAC58074-C58003, and has several these are shown in AAC58012. The protein sequences for protein brahma, and has been shown to be bound to retinoblastoma tumour in the diagnosis and treatment of cancer (for example by gene therapy), postate cancer, to identify drugs useful in the treatment of cancer (for example by gene therapy), of cancer and in the production of animal models for cancer.

The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a genomic sequence encoding a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isolated nucleic acid molecule encoding a reproductive system antigen is used in preventing, treating or ameliorating a medical condition

APPLICANT: Wong, Alexander K.C.
APPLICANT: Tartiglan, Sean V.
APPLICANT: Tartiglan, Sean V.
APPLICANT: Tendy, David H.-F.
TITLE OF INVENTION: BRG1 IS A TUMOR SUPPRESSOR THAT IS MUTATED IN PROSTATE
TITLE OF INVENTION: AND OTHER CANCER TYPES
TITLE REFERENCE: 2318-259
CURRENT APPLICATION NUMBER: US/09/535,008
CURRENT FILING DATE: 2000-03-23
EARLIER APPLICATION NUMBER: U.S. 60/125,806
EARLIER PILING DATE: 1999-03-23
NUMBER OF SEQ ID NOS: 77
SOFTWARE: Patentin Ver. 2.0

                                                                                                                                                                Sequence 1307, Application US/09878178

Patent No. US2002017552A1

GENERAL INFORMATION:

APPLICANT: Judglu

APPLICANT: Harlocker, Susan L.

APPLICANT: Harlocker, Heather

TITLE OF INVENTION: AND DIAGNOSIS OF COLON CANCER

TITLE OF INVENTION: AND DIAGNOSIS OF COLON CANCER

TITLE OF INVENTION: AND UNGHER: US/09/878,178

CURRENT FILING DATE: 2001-06-08

SOFTWARE: FastSEQ for Windows Version 4.0

SEQUID NO 1307
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          APPLICANT: Jiang, Yuqiu
